

BasList vs 1.0.4 – Release Notes

Enhancements

BasList now requires .Net 8.0 or later (<https://dotnet.microsoft.com/en-us/download/dotnet/8.0>)

Added dark and light modes.

Prettyprint enhancements

Colour now used for a wider range of tokens. The full list is:

Token type	Colour
Keyword e.g. PRINT	Blue
Variable	Dark magenta
PROC or FN name	Cyan
Literal string	Green
REM	Yellow / Brown
Mathematical operators (+-/*=<>^) (but not ? ! \$)	Red
GOTO / GOSUB / ON line numbers	Magenta
Line numbering	Grey
All else, e.g. literal numbers, hex numbers, * commands, separators	White / Black

Prettyprint bug fixes

Literal star commands no longer coloured as if an ordinary line.

Miscellaneous

In Z80 mode, programs without line numbers no longer display '0' for each line. Use `/addnumbers` for automatically generated numbers.

`/bare` cancels `/pause` to avoid problems when spooling output.
